The Ultimate Guide to the CPAP Machine

A practical, human-centered handbook for people with sleep apnea

Dumbo Health

Dumbo Health

Manifesto

Dumbo Health – Empower better nights for brighter days

At Dumbo Health, we are here to empower the millions of people who do not get the quality of sleep they need. We believe everyone deserves care that is personal, stigma-free, and within reach.

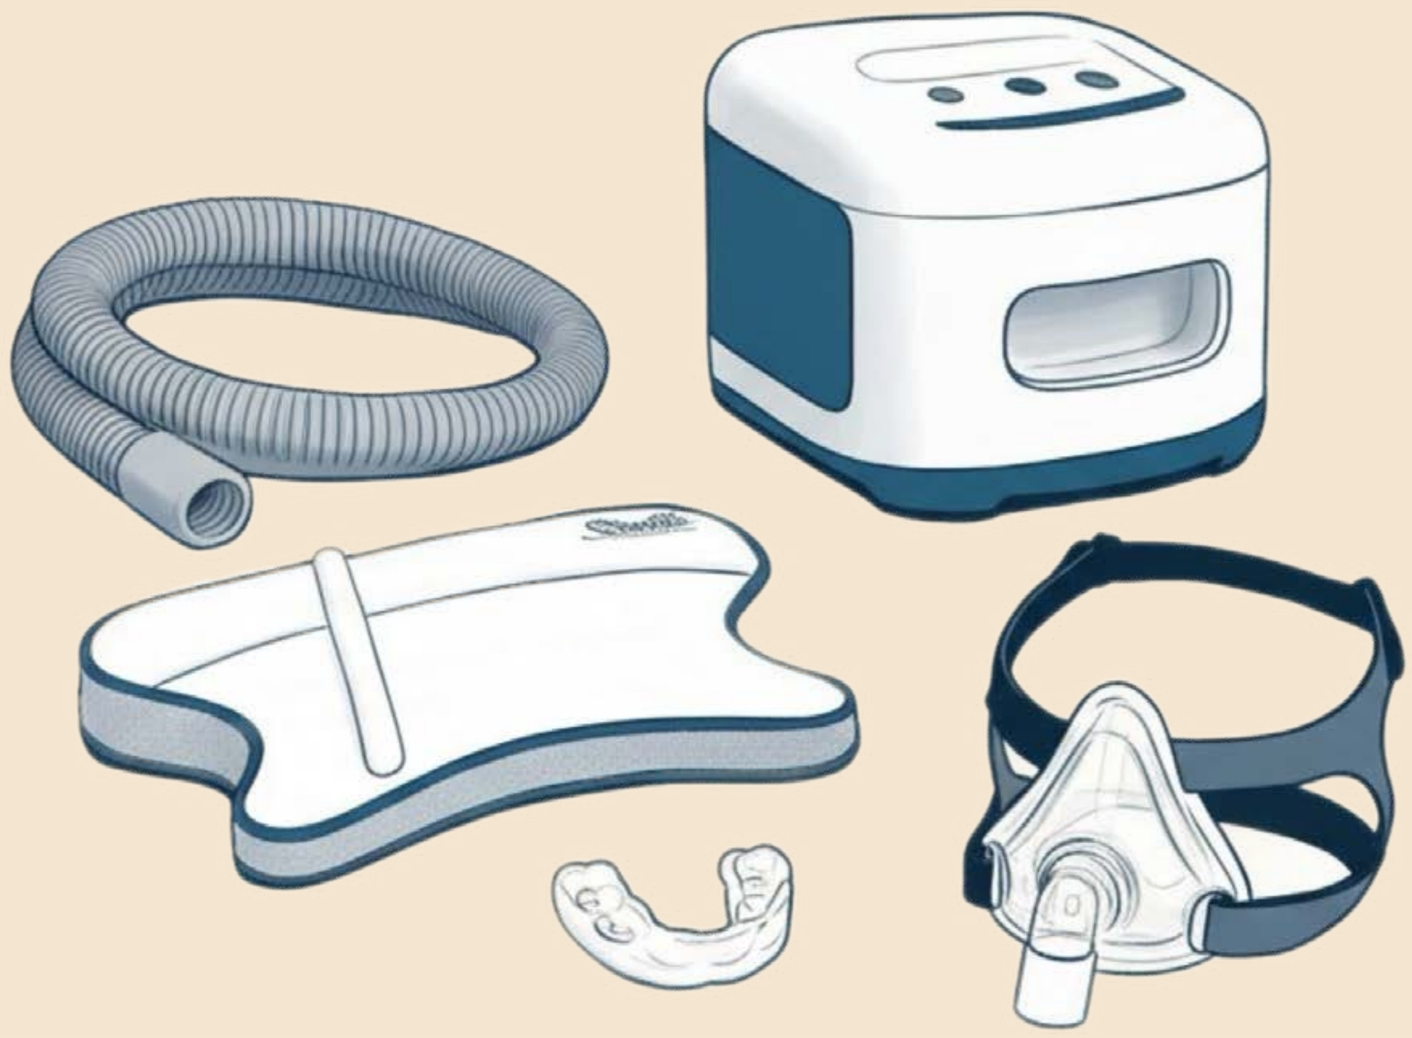
So, we built an all-in-one platform where sleep apnea care transforms into an experience that feels more like self-care. Our all-in-one digital service brings every step into your home, guided by trusted experts, shaped by empathy, and designed for real lives.

We turn complexity into clarity. Through secure technology, you're welcomed into a space where understanding leads the way, from learning and testing, to meeting specialized clinicians and starting therapy with FDA-approved equipment, all from the comfort of home.

Dumbo Health's AI-powered insights craft care as individual as you are, helping you establish empowering routines and experience tangible results: restored energy, renewed mood, and sharper focus.

We champion inclusion, empathy, and empowerment. We stand with those newly diagnosed and with those who have long gone unheard, because better sleep should never depend on your zip code, your pay grade, or your background.

Dumbo Health blends science with warmth, delivering expert-led, design-forward care that feels supportive, not clinical. We guide every member toward lasting confidence, one night of better sleep at a time.



Introduction

If you've just been prescribed a CPAP machine to treat sleep apnea, you probably have questions: What is it? How does it work? And how do I actually get used to sleeping with one?

Why does it work so well? The idea is simple: a CPAP machine delivers a steady, gentle stream of air through a mask. That airflow acts like a splint, keeping your airway open so you can breathe normally, keep oxygen steady, and actually stay asleep. In fact, about 75% of users reach a normal apnea–hypopnea index (AHI), with many others still seeing big improvements.[1]

The payoff is real. "With CPAP, you have significant improvements to the continuity of your sleep, to the daytime function and you also reduce big risks like hypertension, diabetes, heart attacks, and strokes," says Dr. Zach Adams, a board-certified sleep medicine physician and Fellow of the American Academy of Sleep Medicine. Just four hours a night can cut your risk of heart attack or stroke by nearly a third.[2]

Still, not everyone jumps in easily. Only about 59% of people are still using it a year after starting. 3 Some hesitate from the beginning. As Dr. Harrison Gimbel, explains, patients "often have varying outlooks on CPAP with some having a strong interest in it, some hesitant but receptive to it, and some very resistant to it." And some, recalls Dr. Meir Kryger, Professor Emeritus of Medicine at Yale and one of the pioneers of sleep apnea research, even ask: "Is there a pill?"

At Dumbo Health, we don't see CPAP as just a device - it's a pathway. This guide is here to help you understand how it works, what to expect on night one, and how to make it part of your life for the long run.

01

Understand the CPAP machine and its impact on your health

A clear look at what's inside a CPAP machine, how each part works, and how the right mask fit makes or breaks success. You'll also see the real health benefits, from better heart health to sharper focus and happier mornings for you (and your partner).

02

Let's get set-up! Your first night with CPAP

Step-by-step guidance for your first night: how to prepare during the day, what to expect once the mask is on, and how to handle common hiccups like leaks, chipmunk cheeks, or dry mouth. Learn how small wins in the early days build toward long-term success.

03

Let's make it last. Building a long-term relationship with CPAP

Tips for turning CPAP into a habit, avoiding common mistakes, and handling everyday challenges like colds, travel, or power outages. Includes an FAQ with simple answers to the worries most people have when starting out.

04

How to be money smart when buying a CPAP machine

The financial side of CPAP, what machines and supplies really cost, how insurance coverage works, and how to avoid surprises. Learn the difference between renting and buying, what happens if you don't meet compliance rules, and how to budget for the extras without breaking the bank.

Dumbo Health

Chapter 01

Understand the CPAP machine and its impact on your health

Knowing how CPAP works takes away the mystery and makes it easier to trust. Once the parts all come together, you'll see how steady breathing at night leads to deeper rest, brighter mornings, and long-term protection for your health.

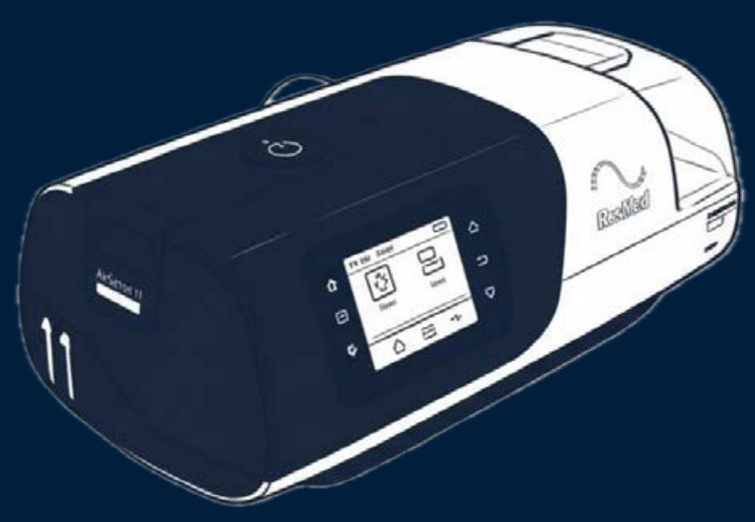
Meet Your CPAP Machine

At first glance, a CPAP machine can look complicated: a box with tubes, chambers, screens, and filters. But really, it's a system built from a handful of simple parts that all work together. Once you know what each piece does, the whole thing feels a lot less intimidating.[4]

Let's walk through it together , piece by piece , so you can see how it all fits and what role each part plays in helping you sleep (and breathe) better.

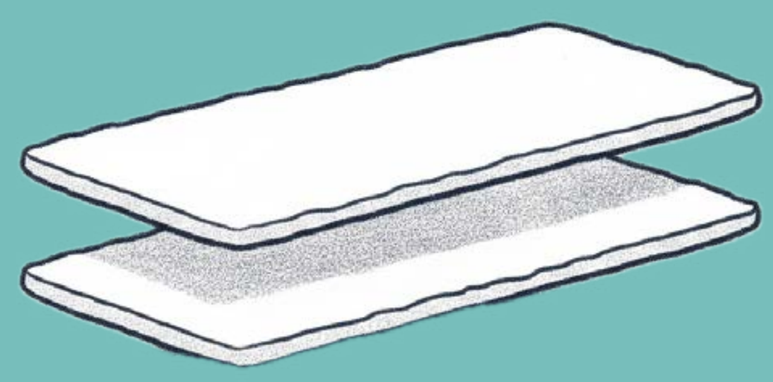
The flow generator (main CPAP)

This is the heart of the machine, the part that creates the steady stream of pressurized air you'll breathe in all night. It's not random: your doctor sets the exact pressure level based on your sleep study. Think of it as the engine that powers everything else. Without it, there's no therapy.



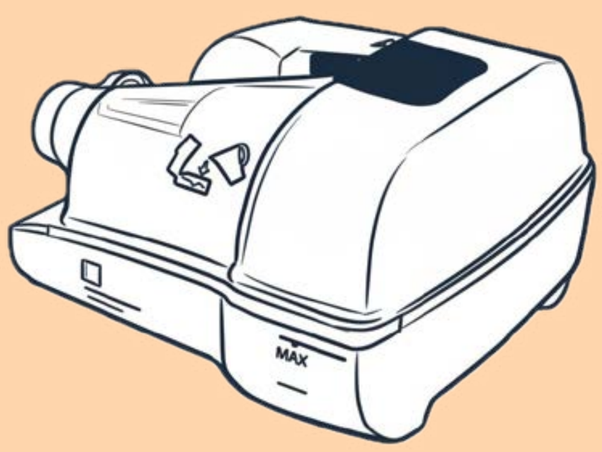
The filter and air intake

The CPAP doesn't just blow air , it makes sure that air is clean before it reaches you. The filter screens out dust, pollen, pet dander, and other small particles. That means what you're breathing is fresh and less likely to irritate your airways. People with allergies often find this feature especially helpful.



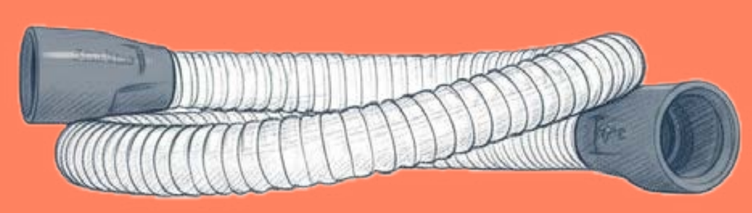
The water chamber (humidifier)

If you've ever woken up with a dry mouth or a sore throat, you know how uncomfortable it can be. That's why most CPAP machines include a humidifier. The water chamber sits on a small heating plate, warming the water just enough to add gentle moisture to the airflow. This keeps your nose, throat, and mouth from drying out overnight, so using CPAP feels a lot more natural.



The tubing

The tubing is what carries the air from the machine to your mask. Standard tubing works fine, but many people use heated tubing. Why? Because it prevents condensation (sometimes called "rainout") from building up inside. Without heated tubing, you might wake up to a drip of water in your mask, not a great surprise at 2 a.m. Heated tubing keeps the air-flow warm and smooth all the way to you.

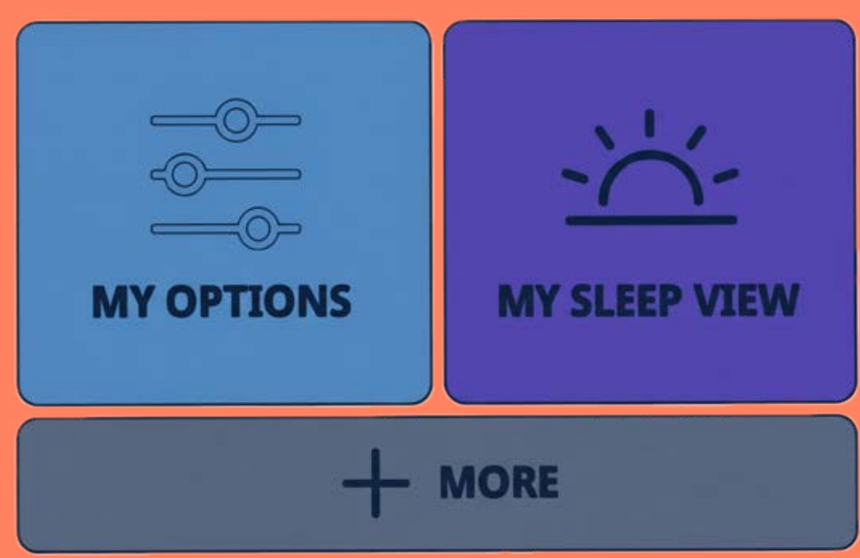


The data card or wireless module

Many CPAPs have an SD card or a built-in wireless chip that records your usage. This helps you see how often and how well you're using therapy. You probably won't interact with the SD card everyday, but it's great to know it's there.

The display screen and controls

The small screen on the machine is where you'll adjust comfort settings like humidity or air temperature. It may also show basic information, like how many hours you used the machine last night.



Your CPAP data, simply used

Your CPAP records basic session information through its SD card or wireless module. "Most clinics or doctors never even look at your CPAP data unless there's a problem that you flag," says Nicolas Nemeth, co-founder of Dumbo Health.

"At Dumbo Health, we use that data proactively, not just to fine-tune your therapy and catch issues early, but also to auto-ship the right accessories when they're actually needed. You don't have to think about reordering filters or tubing, we've got it handled, based on how you really sleep."

In practice, that means the data helps you make sense of the parts you just met: what the flow generator is delivering, what the screen is reporting, how the water chamber and tubing are behaving, and when simple accessories like filters or tubing should be replaced.

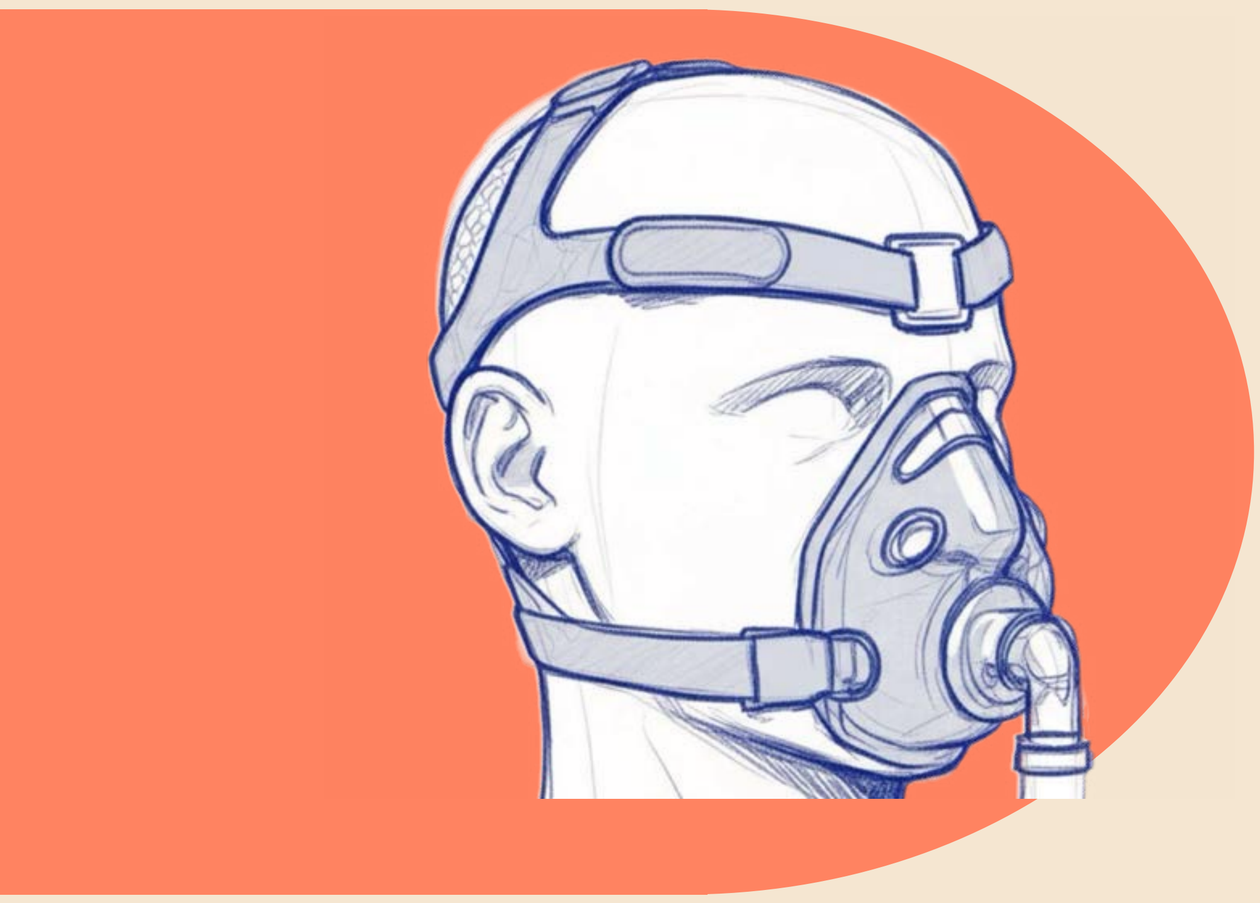
Find the right mask fit

The CPAP machine does the work, but the mask is what makes it possible. If the mask doesn't fit right, it doesn't matter how good the machine is , the air will leak, your sleep will be interrupted, and you may feel tempted to give up. On the flip side, a mask that fits well can feel almost invisible once you're asleep. Mask fit is one of the biggest reasons people either stick with CPAP or stop using it. In other words: getting this part right is key.[5]

Nicolas Nemeth, co-founder of Dumbo Health, says that finding the right fit has gotten easier: "For years, patients had to rely on someone eyeballing their face to guess the right mask, no wonder so many people ended up uncomfortable or giving up. At Dumbo Health, we use a 3D face scan to match each person with the best-fitting mask in the market. It's faster, smarter, and built around you, not guesswork."

Let's look at the main options together.

1. Full-face mask (oronasal mask)

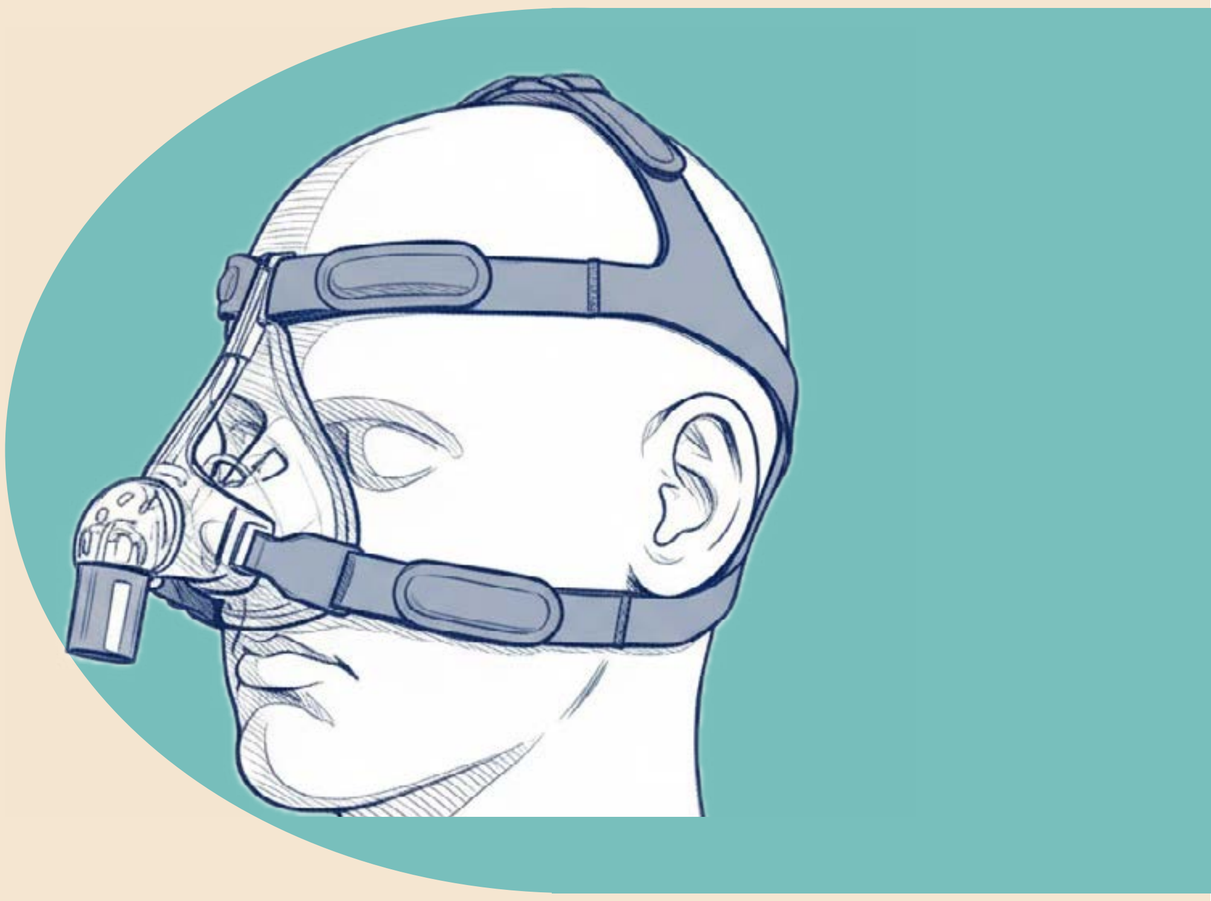


Mouth breathers, people with frequent nasal congestion, or those who need higher air pressures.

+ Covers both your nose and mouth, so even if you're congested or your jaw falls open during sleep, therapy keeps working. Many people find it the most reliable way to get a good seal.

− It's the largest style of mask, so you'll feel it more on your face. Some people notice it's harder to sleep on their side with this mask, and it may leave marks in the morning if the straps are tight.

2. Nasal mask



Most users, especially those who move around in their sleep or need higher pressure without the bulk of a full-face mask.

+ Covers just your nose, giving a balance of stability and comfort. Because it seals around the nose, it often stays in place even if you roll around at night. Paired with a chin strap, it also keeps your mouth from drying out.

− If your mouth falls open while you sleep, you might wake up with dryness or notice the therapy isn't as effective.

3. Nasal pillow mask

People who want the lightest, least confining option, or those with facial hair that makes sealing a larger mask tricky.

The mask sits at the base of your nostrils with soft silicone “pillows.” Because it’s so small, it feels less claustrophobic and gives you a clear view for reading or watching TV before bed. Glasses fit easily, too.

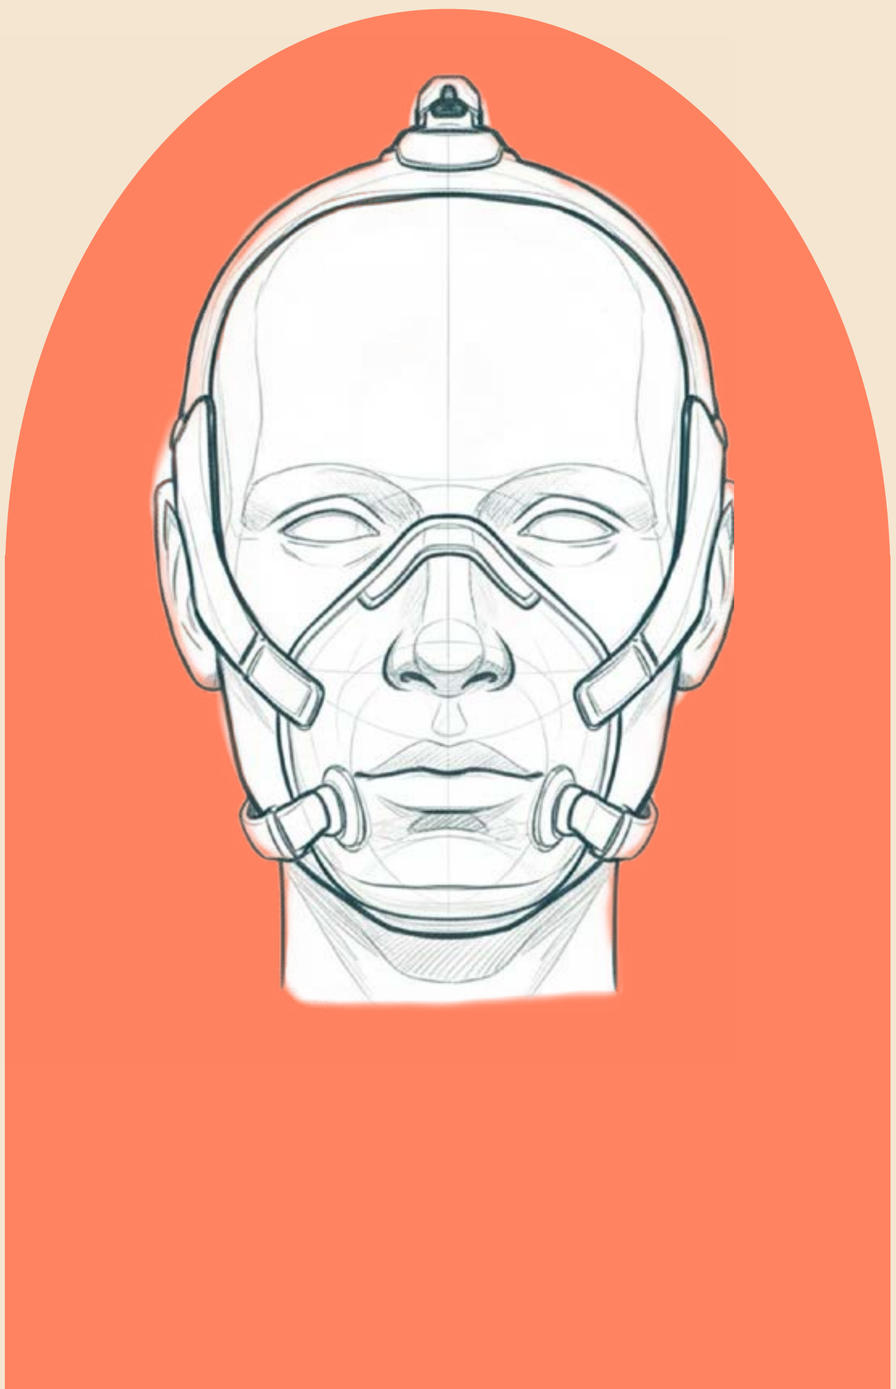
The direct airflow can feel intense at higher pressure settings, and some people notice irritation in the nostrils if the pillows aren’t adjusted just right.

Mouth breathers who dislike full-face masks, or people who want a balance of freedom and coverage.

Combines nasal pillows with a small mouth cushion, so you get therapy through both airways without a bulky frame covering half your face. Many users like the freedom it gives to wear glasses or keep a more open line of sight

Because it has multiple seals (at the nose and the mouth), it can take a bit more patience to get everything adjusted comfortably and consistently.

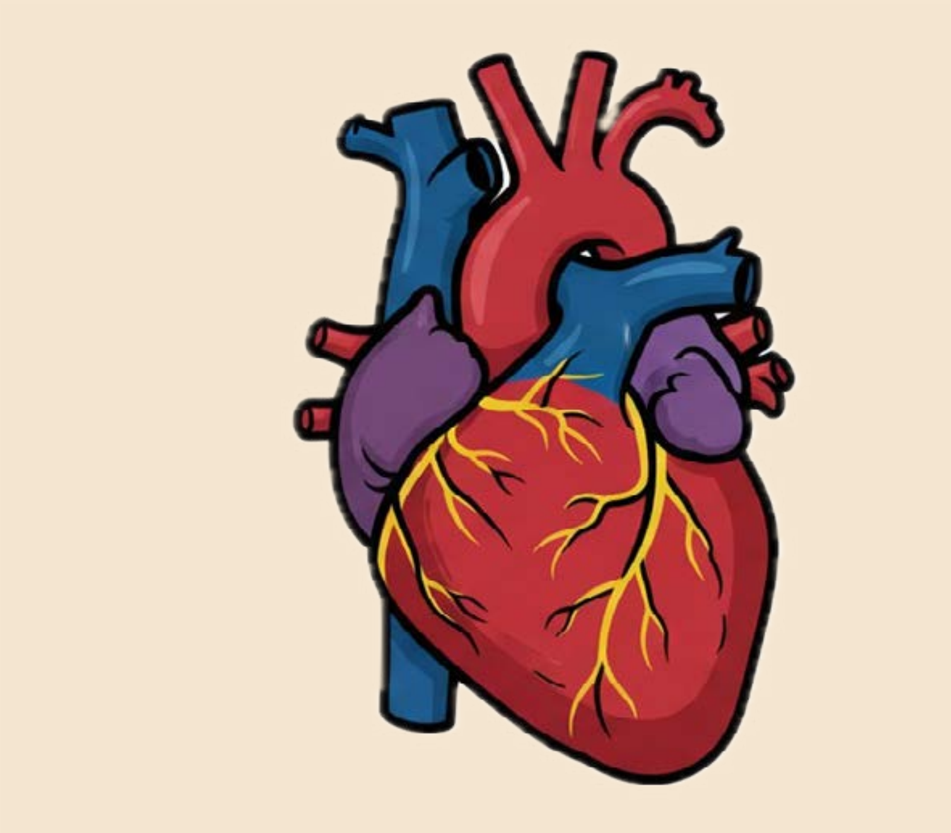
4. Hybrid or oral mask



The benefits of CPAP: Better sleep, better health

Sleep apnea doesn’t only touch your body,it enters your most personal space: your sleep, your rest, even your relationships. CPAP restores steady breathing at night, protecting the heart, balancing the body, and giving back the clarity, energy, and connection that good sleep makes possible.

1. Heart Health



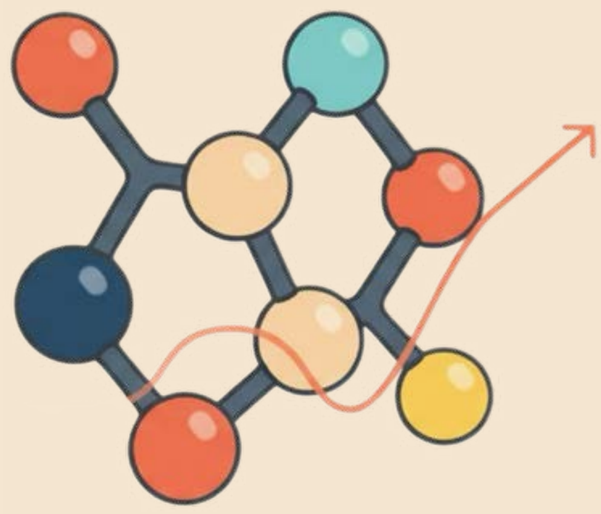
Untreated apnea puts silent pressure on the heart, raising the risk of serious events. CPAP eases that strain and helps people feel safer about their future.

As Dr. Gimbel explains, “If you’ve had a stroke or heart attack, knowing CPAP lowers the risk of another event is a powerful reason to keep using it.”

CPAP keeps oxygen steady at night, which can cut the risk of heart attack, stroke, or cardiovascular death by about ⅓ and lower blood pressure.

2. Metabolic health and inflammation

When sleep is disrupted, hormones and blood sugar levels swing out of balance. CPAP steadies the night, which helps steady the day, especially for people managing diabetes, where even modest improvements reduce the risk of long-term complications.
OSA also fuels inflammation in the body, which adds stress to blood vessels and organs. By keeping breathing steady through the night, CPAP helps reduce those inflammatory markers.



People with type 2 diabetes who use CPAP nightly see their HbA1c drop by about 0.24% after 6 months , a meaningful improvement for long-term health. Inflammation is also lowered with CPAP use.

3. Mood and brain function

The exhaustion of apnea spills into daily life: at work, in conversations, even in memory and focus. CPAP lifts that fog and helps people feel sharper and more present again.

Dr. Adams says, “Sleep continuity and daytime function improve almost immediately. Once patients start to reap the benefits, like better quality of life and more daytime energy, it becomes almost a no-brainer to keep using it.”

After about 6 months of consistent CPAP use, patients often report noticeable improvements in focus, memory, and mood.

4. Improved quality of life for the whole household

Sleep apnea affects partners too. CPAP restores quiet, brings back rest for both, and often improves relationships that felt strained by nightly interruptions.

Dr. Kryger notes, “CPAP can give your bed partner an average of an extra hour of sleep each night once apnea is controlled.”

When CPAP is used consistently, partners often gain an extra hour of sleep per night,and report better mood, more energy, and less conflict at home.

Dumbo Health

Chapter 02

Let’s get set-up: Your first night with CPAP

The first night with CPAP usually isn’t perfect. The mask can feel odd, the airflow takes some getting used to, and the machine’s quiet hum might be distracting. But most people who keep at it agree: it gets easier. With the right approach and a few simple tips, your first night can be the start of a healthier, more energetic life.

STEP 1

Afternoon prep: The dress rehearsal

Your first night with CPAP is about practice and self-compassion. Think of it as a dry run. Trying things out while you're calm and awake helps you avoid the frustration of learning when you're half-asleep. Progress, not perfection, is the goal.

1. Know your prescription

Every CPAP setup is tailored. The pressure is measured in centimeters of water (cm H_2O), usually somewhere between 4 and 20. Most people fall between 8 and 10. Many new patients are prescribed APAP (auto-adjusting positive airway pressure), which automatically adapts through the night.

2. Set up your station

Place your CPAP on a sturdy nightstand, ideally level with or slightly below your mattress. This helps prevent condensation from sliding into the mask. Keep the air intake clear and don't tuck the device into a drawer or against a wall. As Dr. Gimbel points out, "something as simple as where you put the machine can be the difference between frustration and success on the first night."

3. Prep the humidifier

Most CPAPs have a water chamber with a heated plate that adds moisture to the airflow. Always use distilled water, tap water leaves behind minerals that can clog and damage the machine.

4. Get comfortable with the mask

A good seal is everything. If air leaks out, CPAP can't do its job. Slip the mask on, pause to listen and feel. Notice any hissing near your nose or cheeks? Adjust the straps until it's snug but not tight.

As you test the fit, you may notice your cheeks puffing up with air, sometimes called chipmunk cheeks. This usually means the seal isn't quite right or the straps aren't sitting evenly. A small strap adjustment, or switching to a different mask style, usually fixes it.

5. Test it in different positions

Move your head around, roll to your side, even look down at your phone. Small shifts can change the seal, so practicing now saves frustration later. As Dr. Gimbel explains, "Patients who struggle with their CPAP masks at night may benefit from acclimating to it during the daytime by wearing it briefly while watching TV, etc."

6. Practice during the day

Don't wait for bedtime. Try short sessions while reading, watching TV, or scrolling your phone. The airflow may feel odd at first, some people even feel like they can't fully exhale (air hunger). That's normal. Your body usually adapts quickly, and comfort settings like ramp mode or exhalation relief can smooth the process.

As Dr. Kryger notes, "One of the things we often suggest is, 'Watch television with it and see if you can get comfortable.' If someone can't tolerate anything on their face, even while they're awake and distracted, there's very little chance they'll succeed with CPAP at night."

STEP 2

During the night: Finding your rhythm

The first night with CPAP is almost never perfect. You might wake up more often, feel the mask move, or want to take it off. That's normal, everyone's journey looks different. But every hour you keep it on helps you move toward long-term success.

1. Settle in with ramp mode

Nearly all modern CPAPs have a "ramp" feature. Instead of starting at full pressure immediately, the machine gradually builds to your prescribed setting over 15 to 45 minutes. That way you can relax, fall asleep, and only feel the higher pressure once you're already asleep. As Dr. Adams notes, "The ramp lets patients drift off before the full therapeutic pressure begins, and that makes a huge difference for comfort."

2. Breathe normally

When the airflow kicks in, it may feel strange, especially when you exhale. Don't try to overthink it. Just settle into your natural rhythm of breathing in and out. "Patients think the machine will 'force air' into them," says Dr. Adams. "In practice, it's a gentle splint that adapts to your breathing." Relaxing into the flow helps your body adapt more quickly.

3. Handle wake-ups with patience

Maybe the hose has tugged, the mask feels loose, or the sound seems louder in the quiet of the bedroom. Don't feel like you've failed if you need a break. Pause, make small adjustments, and put the mask back on.

4. Plan bathroom trips

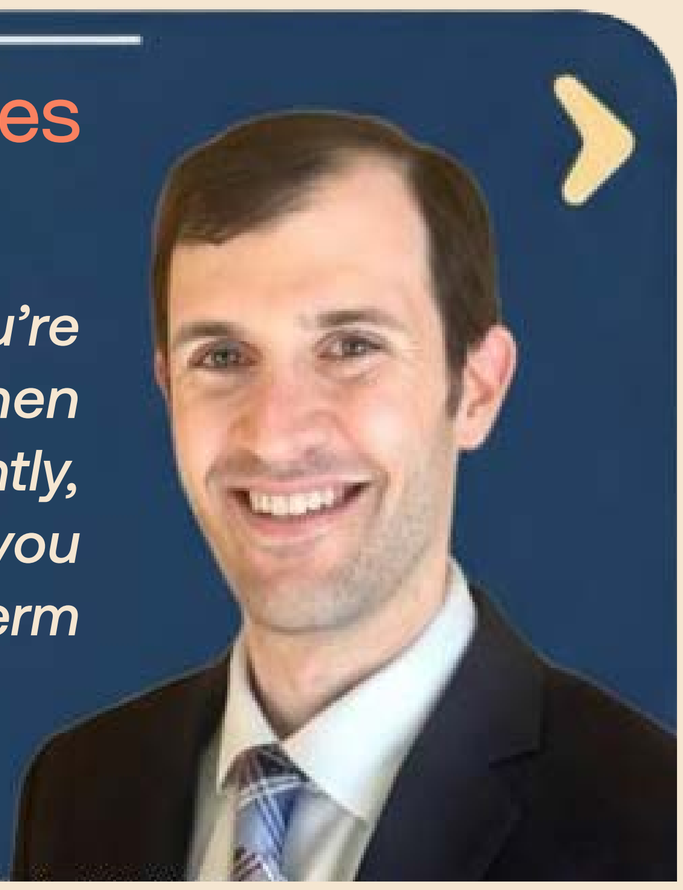
It's common to get up at night. Choosing a mask with quick-release tubing or magnetic clips makes it easy to unhook quickly and get back to sleep without fully waking up.

5. Think progress, not perfection

It's natural to hope for a dramatic change on night one. Some people wake up feeling transformed, but many others notice only small improvements at first. That's okay.

Dr. Gimbel advises

"Expect small gains, and you're more likely to succeed. When you wear the mask consistently, even for part of the night, you lay the foundation for long-term use."



STEP 3

The morning after: Debrief and adjust

You did it. The first night is behind you. Whether you wore the mask for one hour or six, you've already started building the habit that leads to long-term success. Celebrate the win; every start matters. In the morning, take a moment to notice what worked, fix what didn't, and get ready for an easier second night.

1. Check for red marks or soreness

Deep grooves or tender spots usually mean the headgear was over-tightened the night before. Re-fit the mask while lying in your normal sleep position. If marks persist after a couple of nights, ask your supplier to try a different size or style of face mask.

2. Watch for dryness or congestion

Dry mouth, stuffy nose, or "rainout" (water in the hose) are among the most common early complaints and they're usually fixable. Increase the humidifier's heat by one notch, and, if available, turn on heated tubing to reduce condensation. Heated humidification reduces nasal/oral dryness and congestion.

3. Troubleshoot discomforts

Leaks, hissing, or eye irritation often mean the mask fit needs adjusting, try small strap tweaks while lying down, or consider a different style. Dry mouth, nasal stuffiness, and hose condensation ("rainout") are also common early complaints. Sometimes pressurized air slips into the stomach overnight, a side effect called aerophagia. It usually improves with small pressure adjustments from your provider, or by sleeping on your side. As Dr. Kryger puts it, "most early hassles, leaks, dryness, and noise, are solvable with a different mask or a humidifier."

4. Check your data and jot notes

Most machine and app portals display basic information, such as hours used, leak rate, and residual AHI. A quick look in the morning plus a one-minute note ("dry mouth," "leak on side-sleep," "pressure felt high on exhale") gives your clinician actionable information for rapid tweaks.

5. Reset your expectations daily

The first night often brings only subtle changes. You might not wake up feeling fully rested, and that's okay. Improvement builds over days and weeks. "If you expect to feel 20 years younger, there's a good chance you'll be frustrated. Expect small improvements, and you're more likely to succeed," Dr. Gimbel says.

6. Celebrate small wins (they compound)

Every hour counts. The more you use your CPAP each night, the better your sleep, alertness, and heart health can be. Early habits often predict long-term success, so these first weeks are important.

Building confidence from night one

The first nights with CPAP are often the hardest. CPAP therapy is meant to last for life, yet more than half of patients stop using it within the first year. Problems in the first 90 days often predict long-term dropout. Most frustration comes from two things: a poor mask fit and a lack of help.

With traditional care, the DME (durable medical equipment supplier) usually delivers the machine, checks in months later, and replaces parts on an insurance schedule. They rarely look at your data, and your sleep doctor might not be available for weeks. Most people end up trying to fix things on their own.

Dumbo Health changes that experience!

“Support is built right into the patient dashboard,” says co-founder Nicolas Nemeth. “Most early problems such as leaks, dryness, or pressure discomfort already have quick answers available. If that does not help, you can reach a support person anytime or speak with a sleep specialist the same day.” The system also monitors your progress. If your data shows frequent leaks or short usage,
Dumbo Health flags it and reaches out to review what might be happening. “We use your data proactively,” Nemeth explains. “If something looks off, we contact you before it turns into a bigger problem.”

CPAP works when you stay engaged. The effort you put in early builds success that lasts, and with Dumbo Health, you never have to do it alone.

Chapter 03

Let’s make it last! The secrets of a long-term relationship with your CPAP

Starting CPAP can feel like a big adjustment. The machine is new, the routine is different, and it takes time for your body and mind to adapt. That’s normal.

The biggest hurdle isn’t usually the equipment, it’s the idea of doing this every night. Thinking about “forever” can feel heavy, and that’s often when people want to quit. Instead, shrink the focus: you only need to get through tonight. One night becomes a week, then a month, and soon the routine feels natural.

Setbacks don’t erase progress. Missing a night or struggling for a few hours doesn’t mean you’ve failed, it just means you’re still learning. What matters most is putting the mask back on the next night.

Common mistakes to avoid

Even the most determined CPAP users run into challenges. Some problems are easy to spot, like air leaks or dryness, while others are less obvious, like skipping a cleaning or letting the wrong part wear out.

Knowing where people often stumble makes it easier to stay on track and avoid unnecessary frustration, which is key to keeping CPAP working for you over time.

❌ **Thinking one bad night means failure** CPAP is a big change, and many people put pressure on themselves to get it right every single night. So when a night goes badly, frustration can spiral into doubt and, eventually, giving up.	✅ Remember: CPAP isn't all-or-nothing. One missed night doesn't erase your progress. The key is to put the mask back on the next night and keep building the habit.
❌ **Using the wrong pressure setting** Pressure may be too high or too low for your comfort; it can cause discomfort or continued symptoms like snoring or not feeling rested.	✅ Ask your provider if your pressure can be reassessed or adjusted, many machines or follow-ups allow small tweaks.
❌ **Letting hoses, tubes, or humidifier pans stay damp or dirty** Damp, unclean parts breed mold or bacteria. It can cause smells, infections, or irritation.	✅ Routine cleaning and full drying; replace these components on schedule.
❌ **Not keeping track of usage/data** Without reviewing how many hours you use it, leak rates, etc., you may not realize therapy isn't optimal, or problems are creeping in.	✅ Use the machine's data reports/app, or share info with your doctor to spot issues early.
❌ **Not preparing for bumps in the journey** Trips, power outages, and stays elsewhere often derail use because people don't bring everything they'll need. Missing even a few nights undermines habit building.	✅ Pack your CPAP essentials when traveling; test battery/inverter ahead; have a checklist for nights away.
❌ **Using CPAP when sick without adjusting care** Colds, allergies, congestion make therapy harder: mask fit might leak more, humidifier settings may need adjustment. Ignoring this makes discomfort worse.	✅ When you're sick, use higher humidity, saline nasal sprays, perhaps a different mask or adjust mask fit; talk to the provider if symptoms persist.
❌ **Neglecting firmware/software updates / machine maintenance** Like any device, CPAPs sometimes have software/firmware updates or performance issues. Old firmware or unmaintained parts may not perform as quietly or accurately.	✅ Check in with your supplier/manufacturer; install updates; make sure filters and parts are working well and replaced on schedule.

CPAP FAQs: Simple answers to common worries

When you're new to CPAP, it's natural to have questions. What will the first week feel like? How do you keep it clean? What happens if the power goes out? These aren't small details, they're the things that decide whether therapy feels doable in everyday life.

Getting straightforward answers early on can take the guesswork out of CPAP, so you can focus less on the "what ifs" and more on getting the sleep you need for the long haul.

1. How do I know CPAP is worth trying

If your doctor prescribed CPAP, it means your sleep apnea is at a level where treatment can make a real difference. This isn't just about snoring, untreated apnea can raise your risk of heart disease, high blood pressure, and daytime accidents from fatigue. People who stick with CPAP often notice more energy, sharper focus, and a better mood within weeks. Over time, it also lowers long-term health risks and helps partners sleep better too.

2. What will the first week feel like

When progress feels slow, it's natural to want to stop. Instead of aiming for perfection, aim for small wins: two hours tonight, a little longer tomorrow. These hours add up, and the benefits show once the habit takes root. Walking away too soon shuts the door before your body has a chance to adjust. "If someone manages three or four hours a night in the first week, even if it's broken up, they're much more likely to keep going," explains Dr. Gimbel. Think of it as breaking in a new pair of shoes: not perfect at first, but more natural each time.

3. What if I don't feel better right away

Not everyone feels instant results. For some, energy improves in days; for others, it may take weeks. That's normal. "People want an instant cure. But with CPAP, it is consistency that builds the payoff. It's the habit that delivers the benefits," says Dr. Adams. Stick with it, as Dr. Kryger puts it, "When people give up in week one, they lose the chance to see the benefits."

4. Do naps count, or just nighttime sleep

Naps matter just as much as nights. Using CPAP every time you sleep teaches your brain that “sleep = CPAP.” If you skip it during naps, your body never fully adjusts. Even short naps help reinforce the routine.

5. What features make CPAP more comfortable

Modern machines are designed with comfort in mind. Common options include:

1. Heated humidifier: Adds moisture to stop dry mouth and congestion.
2. Heated tubing: Keeps air warm and prevents condensation (“rainout”).
3. Ramp mode: Starts with gentle pressure and gradually rises once you’re asleep.
4. Exhalation relief: Lowers pressure slightly when you breathe out, so breathing feels natural.

6. How much does CPAP cost, and does insurance cover it

Without insurance, machines usually cost around $1,000, plus ongoing supplies. The good news is most insurance plans cover CPAP, but they often require “compliance”: proof you’re using it at least 4 hours a night on 70% of nights in the first 90 days. After that, coverage continues if you show it’s helping you. It’s worth asking your provider upfront about what’s covered, so you’re not surprised.

7. How do I clean it

Cleanliness matters because air flows directly into your lungs. A simple routine is best:

- Daily: Rinse the mask cushion with warm, soapy water and let it air dry.
- Weekly: Wash the tubing, mask, and water chamber in warm, soapy water; rinse thoroughly and let them dry completely before re-assembling.
- Replacement: Swap filters, cushions, and hoses regularly.

Avoid bleach, alcohol, or ozone “quick cleaners.” They can damage the machine and aren’t proven safer. Good cleaning keeps the air fresh and prevents mold or bacteria from growing in damp parts.

8. How long does a CPAP machine last

Most machines last five years on average with regular care. Supplies wear out faster: masks and cushions every few months, filters every one month, and importantly tubing every three months to prevent contamination, maintain hygiene. Over time, the tubing can develop small holes, reducing the air pressure you receive, and also harbor bacteria, oil, and other contaminants. Think of it like car maintenance, the main unit lasts years, but small parts need routine swaps to keep everything running smoothly.

Dumbo Health replaces accessories based on real, actual sleep data and not randomly. According to how much you use your machine, we will always replace their accessories based on the real actual lifetime value of the accessory.

9. What happens if the power goes out

CPAP only works when it has electricity, so if the power cuts off, the therapy stops, and that can mean a restless night. Luckily, there are reliable backup options:

- Dedicated CPAP batteries: These are lightweight, rechargeable packs made to plug straight into your machine. On a full charge, most last 1–2 nights depending on your pressure settings and whether you're using the humidifier. Some brands also let you chain two batteries together for extra time.
- Universal power stations (portable generators): Larger rechargeable power stations can run a CPAP for several nights. They're bulkier than CPAP-specific batteries but useful if you want backup for the whole household.

10. What if I travel a lot? Will CPAP still work for me

Absolutely. Airlines let you bring CPAP on board as medical equipment at no extra charge. There are travel-sized CPAPs that weigh just a pound or two, and portable batteries for nights without outlets, whether that's camping, road trips, or staying somewhere with unreliable power. Most CPAPs also auto-adjust to different voltages, so you can use them internationally with just a plug adapter.

"There are travel machines that are quite a bit smaller and lighter and maybe easier to move around. There are battery packs if they're camping or just in an area where they don't have access to electricity. So there's ways to make it work," explains Dr. Adams.

11. Is CPAP safe for kids

Yes! But kids need pediatric machines and masks designed just for them. The pressures are gentler, and a pediatric sleep specialist monitors their therapy. Children should never use an adult CPAP, since the airflow would be too strong and the mask wouldn't fit safely.

12. Isn't CPAP noisy and embarrassing

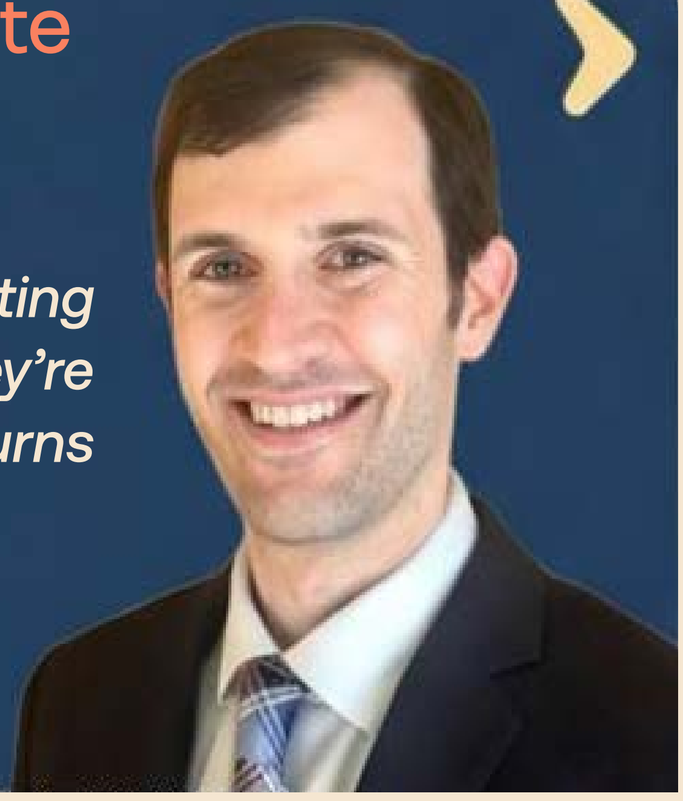
Old machines had a reputation for being bulky and loud. Today's CPAPs are designed to be much quieter, usually around 25–30 decibels, about the level of a whisper. Most partners actually find the soft hum less disruptive than untreated snoring, and many say it becomes soothing background noise.

Patients are often surprised when they see the machine for the first time. "Patients often walk in expecting 'a big box by the bed,'" says Dr. Gimbel, "and they're surprised when the device turns out to be small and quiet."

Confidence grows when you realize you're not alone. Millions of people use CPAP every night, and once it becomes part of your routine, it feels like just another step before sleep.

Dr. Gimbel's quote

"Patients often walk in expecting 'a big box by the bed', and they're surprised when the device turns out to be small and quiet"



What to do when you feel like giving up?

Try these quick resets:

Aim small: Even 2–3 hours with CPAP is better than nothing. Take a break, then retry: Remove the mask, breathe, and put it back on.

Make one change: Adjust humidity, loosen the straps, or try a different mask style.

Reach out: Call your sleep team, most fixes are simple.

Reframe the thought: Don't think forever. Think just tonight.

Chapter 04

How to be money smart when buying a CPAP machine

CPAP therapy can transform your sleep, but let's be honest, the money side is just as important as learning your machine. Understanding the costs, insurance fine print, and your options will save you stress and help you feel in control. And that's exactly why Dumbo Health exists: to make sure the financial side doesn't weigh you down.

🛡️ Insurance basics you need to know

Insurance can make CPAP therapy look simpler than it is. Many plans do cover it, but the details often come with strings that catch people by surprise.

9⃣0⃣ The 90-day compliance rule

Most insurers (including Medicare) require you to use your CPAP machine for at least **4 hours per night on 70% of nights in the first 90 days**. If you don't meet this rule, your coverage can be revoked, or worse, you can be asked to refund all costs since the beginning of your journey (including the diagnosis portion).

🗒️ Proof Required

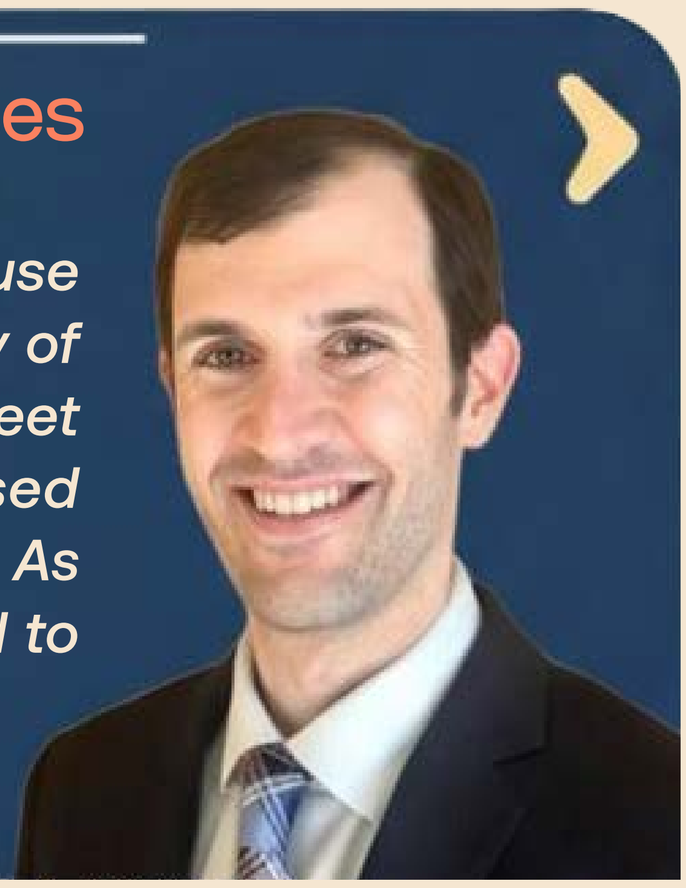
CPAP machines track your usage data and automatically send it to your doctor or insurer. If you fail to meet the minimum usage, coverage can be denied or clawed back, meaning patients may be held responsible for the full price of the machine and sleep study.

❗ When Things Go Wrong

You'd think getting a CPAP through insurance would make things simpler. For many people, it does the opposite. The process is full of fine print, and missing just a few nights of use can turn a covered treatment into a massive bill.

Dr. Gimbel advises

"Some patients want to use CPAP, but due to a variety of reasons, are unable to meet the initial insurance based hours of use requirements. As a result, they are required to return the machine"



Nicolas Nemeth, co-founder of Dumbo Health, says he often sees patients who are blindsided by unexpected bills after using insurance for CPAP. “People share stories of being charged $5,000 to $10,000 for equipment they thought was covered, simply because they didn’t meet compliance hours,” he explains. “It’s shocking how often patients have no idea what those rules even are until they get the bill.”

He adds that even those who stay compliant can face surprise costs. “I’ve seen patients paying $250 to $300 a month in rental fees for equipment they believed was fully covered,” Nemeth says. “It shows how little transparency there really is in the process.”

Why insurance doesn’t always mean affordable

Even if you meet the compliance rules, you might end up paying more than you expect:

- **No pricing cap:** In the U.S., there is no limit on what can be charged for DME (durable medical equipment). Insurers may pay inflated rates and pass some of that cost to you.
- **Hidden copays and deductibles:** If you haven’t met your annual deductible, you’re on the hook for the full cost, and full cost means full insurance cost, not market cost. Even after that, coinsurance often leaves you with hundreds of dollars in bills.

This complexity creates real stress. And when you’re trying to fix your sleep, stress is the last thing you need.

What CPAP really costs

Buying out-of-pocket

Without insurance, most standard CPAP machines cost around $1,000 depending on the model and features. Travel-friendly or advanced auto-adjusting machines can run higher, sometimes up to $2,000+.

With insurance

Your actual cost depends on your plan:
Deductible: If you haven't met your deductible, you might pay the full sticker price up front.
Coinsurance/copay: After the deductible, many plans cover a big portion of the machine, leaving you with a smaller share, often a few hundred dollars.

Don't forget the extra accessories

One of the biggest surprises for new CPAP users is that the costs don't stop with the machine. The accessories that keep it running, masks, hoses, filters, humidifier chambers, need to be replaced on a regular schedule.

As Dumbo Health co-founder Nicolas Nemeth puts it: "A CPAP machine is like a coffee maker, it doesn't work on its own. You wouldn't expect to buy a coffee maker and never replace the pods, filters, or clean it. Same with CPAP, the machine matters, but it's the accessories that keep it working and keep you healthy."

With insurance, supplies are often covered, but deductibles and copays still apply. Without insurance, the extras can add up to $250 to $600 a year. And on top of that, doctor visits come with their own bills whenever you need help or an adjustment.

For many patients, those ongoing costs are what turn CPAP from affordable to stressful. That's why Dumbo Health built its model to include every part you'll need, so there are no surprises down the road.

At Dumbo Health, every extra is already included. The machine, the supplies, the check-ins, even the support,it's all rolled into one monthly plan. No surprise bills, no hidden rules, no separate parties to chase. Just one simple path that keeps your costs clear and your focus where it belongs, on getting good sleep.

Quick checklist: Keeping CPAP affordable

How to meet the 90-day usage rule

1. Check your deductible and coinsurance so you're not surprised by the first bill.
2. Always use in-network suppliers to avoid higher costs.
3. Consider going out-of-pocket to avoid deductible, co-pays and insurance hurdles
4. Budget for supplies, even with coverage, you'll pay something out of pocket.
5. Check-out monthly subscription by Dumbo Health that offers everything included in their plans, often cheaper than your insurance co-pay
